

SNIPER SHOT™

SERIES

Increase your accuracy with Sniper Shot Series binary exploding targets by Tannerite®

Sniper Shot Series has the same effect as a standard 1/2 lb rifle target with minimum noise.

This is to be used as 40 single shot indicator.

Directions:

1. Measure 8oz (half of the mixer jar) from large 5lb orange bag.
2. Pour into small orange target pouch.
3. Add prepacked silver catalyst.
4. Seal pouch. Shake for 30 seconds or until visibly mixed.
5. Place target a minimum of 100 yards downrange, clear of any debris or potential hard objects.
6. Ensure shooter and all spectators have eye and ear protection at all times.
7. Shoot for the center of the Tannerite® logo bullseye.

WARNING: When mixed correctly, United Nations testing labs have proven that Tannerite® targets cannot start a fire in and of themselves. Secondary fires may occur if not used correctly. Examples include: not following instructions, incorrect mixing ratio, patent infringing targets, rim fire targets which have chemicals, leaving catalyst packs inside target, confining targets in certain materials, etc.

PERMITS: You should always check with your local authorities before shooting Tannerite® targets. There may be a permit, or future permit required. For instance, if you can use Tannerite® targets without a permit for personal use, put it online and receive payment from your channel, it may be considered "commercial use" which may require one or more permits/licenses from different government agencies.
